Catch it being wrong

Lesson 3 notes. Fill in the blanks as we go.

If every book is real, how could the answer still be wrong?

- The overview was written _____ the books were found.
- It can sound _____ and still be guessing.
- A book can be about the _____ but not the _____.
- The Record can be thin, so you may need the _____ itself.

Four steps

Step	Ask yourself
Question	What does the answer claim? What might be missing?
Check	What evidence supports it? Which claims need checking?
Compare	Check it against reliable sources: the Record, then the book.
Decide	What is trustworthy, what needs fixing, what shouldn't be used?

Three verdicts

Mark	Verdict	It means
✔	Checked	A book _____
✘	Wrong	A book _____
○	Not in our books	_____ _____

"It's AI so it's probably wrong" is not a verdict. To mark something wrong, show the line that contradicts it.

What it's good and bad at

- You can ask about almost any subject, math included. The overview is often a useful start.
- It can be wrong about any of it, multi-step math especially. Check the steps yourself or in a book.
- It's strongest at finding books in our collection, because that comes straight from our Catalog.
- "The library's catalog has nothing on this yet" is an honest answer. The overview is then unchecked.

Our answer audit

The claim (Question)	What would prove it? (Check)	What we found, and where (Compare)	✔ ✘ ○ (Decide)

Take it with you

- **Real books don't make the overview right.** It was written before the books were found.
- Check the **claim**, not just that books were listed.
- Use the steps: **Question, Check, Compare, Decide**.
- Being wrong about one thing doesn't make everything wrong. Show your evidence.

Check yourself

1. Why can an overview be wrong when every book under it is real?
2. What are the three verdicts, and what does each one need?
3. What was the hardest kind of mistake to catch? Why?
